The Golden Hour
Goals of the Golden Hour

- Promote Bonding
- Prevent Heat Loss
- Establish Early Feeding/Prevent Hypoglycemia
The Golden Hour Overview

- Immediate skin-to-skin
- Delayed Cord Clamping
- Establish Early Feeding
- Defer assessments and interventions until after first feeding
  - Eyes/Thighs, weighing, full assessment
  - APGARS can be assessed while skin-to-skin
Skin-to-Skin Works!
Benefits to mom

- More rapid uterine involution
- Decreased postpartum blood loss
- Increased postpartum weight loss
- Less anxiety, more confidence in parenting
Safe Sleep and Skin-to-Skin Care in the Neonatal Period for Healthy Term Newborns

Lori Feldman-Winter, MD, MPH, FAAP, Jay P. Goldsmith, MD, FAAP, COMMITTEE ON FETUS AND NEWBORN, TASK FORCE ON SUDDEN INFANT DEATH SYNDROME
BOX 1: PROCEDURE FOR IMMEDIATE SKIN-TO-SKIN CARE

1. Delivery of newborn
2. Dry and stimulate for first breath/cry, and assess newborn
3. If the newborn is stable, place skin to skin with cord attached (with option to milk cord), clamp cord after 1 minute or after placenta delivered, and reassess newborn to permit physiological circulatory transition
4. Continue to dry entire newborn except hands to allow the infant to suckle hands bathed in amniotic fluid (which smells and tastes similar to colostrum), which facilitates rooting and first breastfeeding
5. Cover head with cap (optional) and place prewarmed blankets to cover body of newborn on mother’s chest, leaving face exposed
6. Assess Apgar scores at 1 and 5 minutes
7. Replace wet blankets and cap with dry warm blankets and cap
8. Assist and support to breastfeed
BOX 2. COMPONENTS OF SAFE POSITIONING FOR THE NEWBORN WHILE SKIN-TO-SKIN\textsuperscript{62}:

1. Infant’s face can be seen
2. Infant’s head is in “sniffing” position
3. Infant’s nose and mouth are not covered
4. Infant’s head is turned to one side
5. Infant’s neck is straight, not bent

6. Infant’s shoulders and chest face mother
7. Infant’s legs are flexed
8. Infant’s back is covered with blankets
9. Mother-infant dyad is monitored continuously by staff in the delivery environment and regularly on the postpartum unit
10. When mother wants to sleep, infant is placed in bassinet or with another support person who is awake and alert
Barriers
THE GOLDEN HOUR
The Golden Hour refers to the first hour of a newborn’s life. This is a very special time for bonding and transitioning to life outside the womb. We ask that mother and baby remain Skin to Skin during this time.

Direct skin-to-skin contact has numerous benefits for mom and baby.

For Baby:
- Cries less
- Regulates breathing and heart rate
- Maintains temperature
- Higher and more stable blood sugars
- Early stimulation of immune system
- Calming during procedures
- Baby is more likely to exclusively breastfeed and breastfeed for a longer period of time

For Mom:
- Decreases chances of excessive bleeding
- Decreases anxiety and pain
- Increases bonding with baby
- Makes it easier to recognize and respond to infant cues
- Builds confidence in infant care

Visitors please respect this special time for our new parents and baby by remaining in the waiting area.
Skin to Skin in the OR

- Teamwork!
  - Involve physician, anesthesia & support person
  - Requires constant supervision
Where there’s a will...
Substitutes are sometimes needed…but be prepared.
Sudden Unexpected Postnatal Collapse of the Newborn (SUPCN)

- Possible Risk Factors
  - Primiparous mother
  - First breastfeeding
  - Newborn in prone position
  - Mother in supine position during skin-to-skin contact
  - Lack of surveillance by health care staff
  - Parental distraction, such as with smartphones
  - Maternal opiate analgesia or regional or general anesthesia
  - Magnesium sulfate
  - Maternal BMI > 25 kg/m²
What to do about SUPCN

- IDENTIFY INFANTS AT RISK
- Elevate HOB
- Observe for the first 2 hours
- Assess position at breast
- Educate parents and support persons
Babies at Risk for Cold Stress

- Preterm/SGA
  - Less Brown Fat and insulating white fat
  - Greater surface area in relation to body weight
  - Thinner skin

- Sick Babies
  - Stress on metabolism related to increased oxygen and calorie use

- Babies with open defects
What are some Interventions to Reduce Heat Loss??
- Dry infant
- Warm blankets
- Hat
- Avoid Drafts
- Room Temperature
Non-Shivering Thermogenesis

- Heat is produced by increasing metabolism, especially in brown adipose tissue

1. Cold environment sensed
2. Hypothalamus stimulated
3. Brown adipose tissue metabolized
4. Heat generated
Brown Fat Distribution
The Radiant Warmer

- Probe placed on abdomen, typically RUQ
- Set Servo at 36.5C
Recommended Delivery Room Temperature

- Term: 72-78 F (AAP)
- Preterm: 74-77 F (NRP)
  - WHO suggests 77-82 F
Thermal Protection of the Newborn: a practical guide

Adults should not determine the delivery room temperature according to their own comfort.

Maternal and Newborn Health/
Safe Motherhood Unit
Division of Reproductive Health (Technical Support)
World Health Organization
Geneva
What about in the OR?

- From AORN:
  - The recommended temperature range in an operating room is between 68°F and 75°F. Collaborate with infection prevention, and facility engineers when determining temperature ranges. Each facility should determine acceptable ranges for temperature in accordance with regulatory and accrediting agencies.

Special Considerations: The Premature Infant
Therapeutic / Neuroprotective Hypothermia for treatment of Hypoxic Ischemic Encephalopathy

Unintentional / Accidental Hypothermia and Rewarming Guidelines
Acute Perinatal Events

**Impaired Placental – Fetal Perfusion**

- Causes → placental abruption, uterine rupture, prolapsed / ruptured cord, maternal collapse requiring CPR
- Results in ↓↓ fetal cardiac output → poor perfusion and oxygenation of fetal organs and brain → ischemic injury

**Asphyxia**

- Term used to describe impaired gas exchange that results in hypoxemia and hypercarbia
Acute Perinatal Events

**Birth Asphyxia**
- Known perinatal event capable of impairing perfusion and $O_2$ delivery
- Results in hypoxia, acidemia and metabolic acidosis

- Severe Hypoxemia
- Anaerobic Metabolism
- Lactic Acid Production
- $\downarrow$ pH
- End Organ + Brain Damage
- Hypoxic–Ischemic Encephalopathy (HIE)
Acute Perinatal Events

Hypoxic-Ischemic Encephalopathy (HIE)
- Initial ischemic insult → cascade of events leading to neuronal death

- Striate vessels underperfused → watershed injury to areas of distal perfusion
- Diffuse white matter injury
- Perinatal event disrupts brain perfusion and oxygenation → severely hypoxemic blood → causes brain hypoxia and ischemia
Hypoxic Ischemic Encephalopathy

Resuscitation and stabilization factors associated with worsened neurologic outcomes

- Hyperthermia
  - Prevent hyperthermia at all times
  - Treat fever quickly
- Hypoglycemia → low glucose is not uncommon
  - Be vigilant! Evaluate glucose often
  - Aggressively treat with D$_{10}$W bolus if low
  - Maintain the blood sugar 50 – 110 mg/dL (2.8 – 6 mmol/L)
Phases of HIE

- **Primary Energy Failure** – initial insult results in cell swelling and necrosis
  - Occurs prior to hypothermia therapy and not affected by treatment

- **Secondary Energy Failure** – Reperfusion of the brain, lack of oxygen leads to apoptosis
  - Can be impacted with hypothermia

- **Latency Period** – period between these two phases that allows for a therapeutic window of treatment

- **These phases can each occur in utero**
Therapeutic Hypothermia

*Used as a neuroprotective therapy to treat HIE*

- Intentional lowering of body temperature to approximately 33.5°C for 72 hours
- Done in a controlled NICU setting
- Only major therapy available to ↓ mortality rate and ↓ chance for major disability
Therapeutic Hypothermia

Candidates

- Started within 6 hours of birth
- ≥ 36 weeks gestation
- ≥ 1800 grams
- Blood gas (cord or neonatal within 1st hour of life) pH ≤ 7.0 or base deficit ≥ 16
  - If no blood gas available → other criteria used
- Abnormal neurologic exam

⚠️ Consult your tertiary care center quickly to discuss candidacy for cooling and whether passive cooling should be initiated prior to arrival of the transport team

© K. Karlsen 2013
Passive Cooling

- Turning off radiant warmer – no external heat applied to newborn
- Place newborn on UNACTIVATED heating mattress – absorbs heat from baby
- Initiates cooling earlier
- Performed only under guidance of receiving physician
